SOCIAL MEDIA CONTENT ENGAGEMENT ANALYSIS

DATA DASHBOARD | TEAM ID: DA-020

Invertis University | B.Tech CSE, 3rd Year | Mentor: Mr. Arsh Singh | Academic Year: 2026–2027

Dataset overview

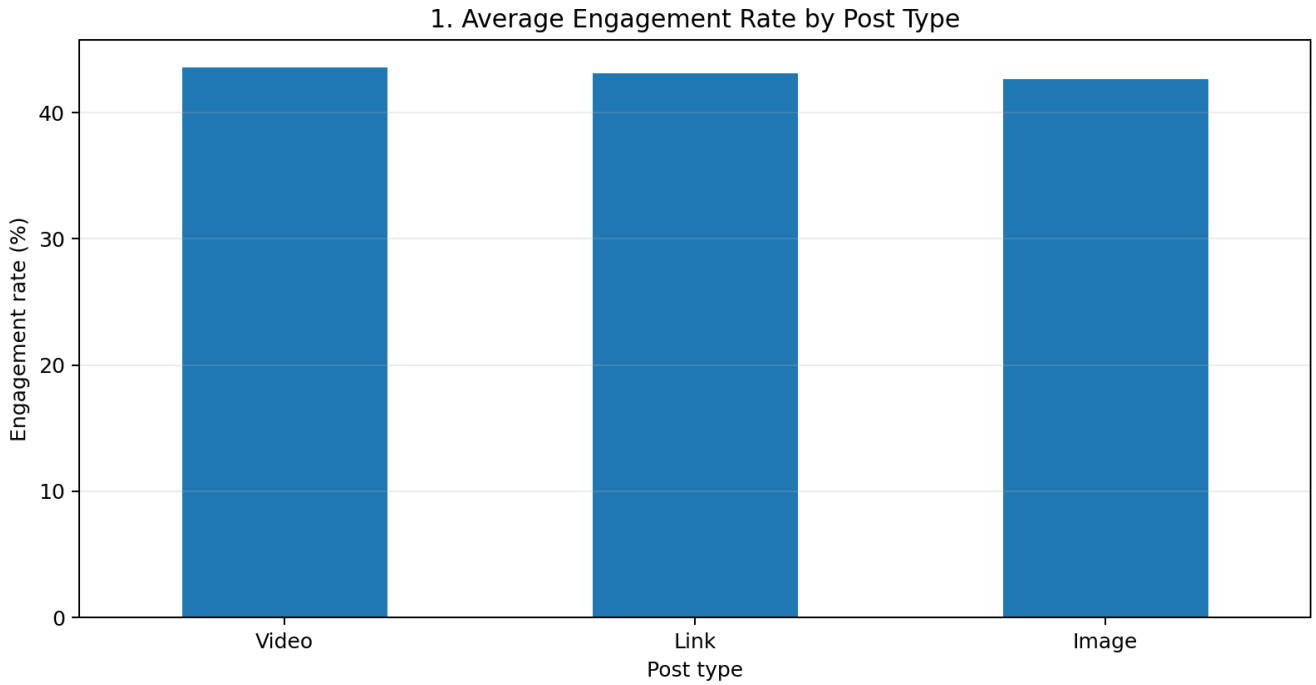

Records analysed	19,885	Date coverage	08 Mar 2021 – 08 Mar 2024
Average total engagement	849.2	Platforms	4
Post formats	3	Average likes / comments / shares	499.7 / 249.4 / 100.1

Highlights from the supplied processed dataset

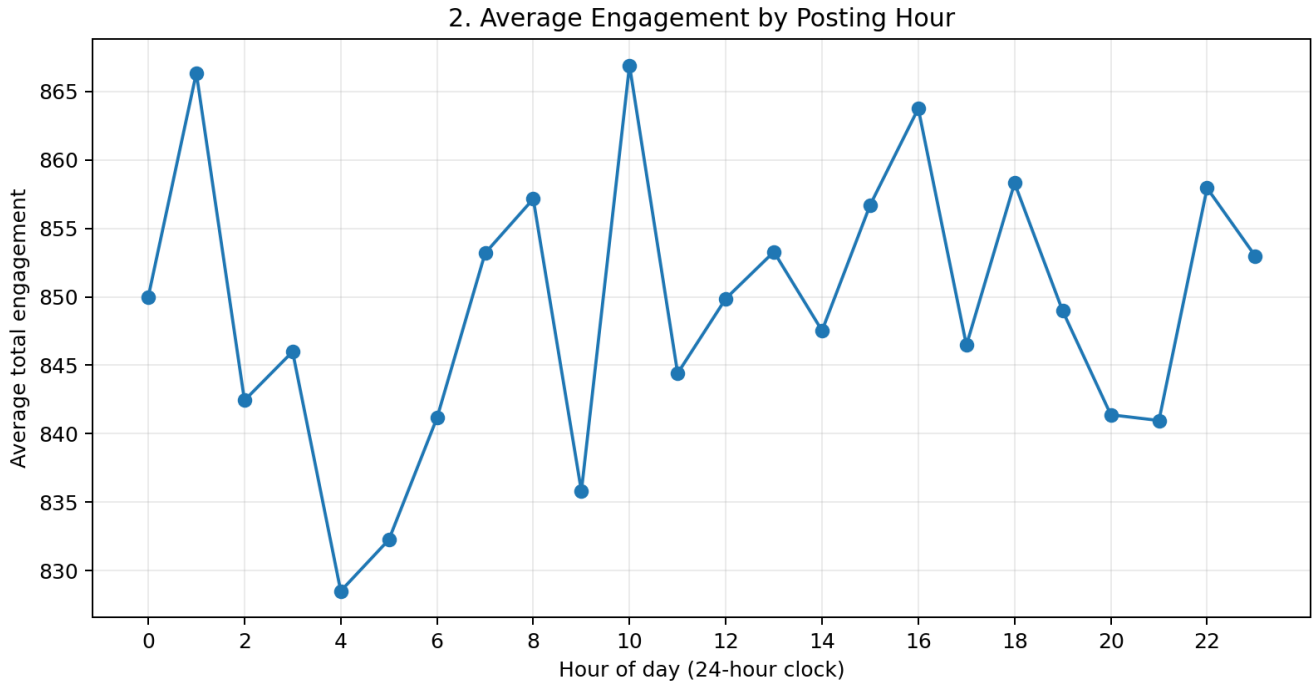

• Highest average impressions-based engagement rate by post type: **Video** (43.58%).
• Highest average total engagement by posting hour: **10:00** (866.9).
• Platform with the highest average impressions: **Twitter** (2,336.9).
• Highest average monthly total engagement: **2022-07** (886.7).

Metric note: The notebook recomputes engagement_rate_pct as (likes + comments + shares) ÷ impressions × 100. The supplied CSV also contains a separate engagement_rate field and reach-based rate columns; these are not interchangeable. This dashboard uses the notebook's recomputed impressions-based rate for chart 1.

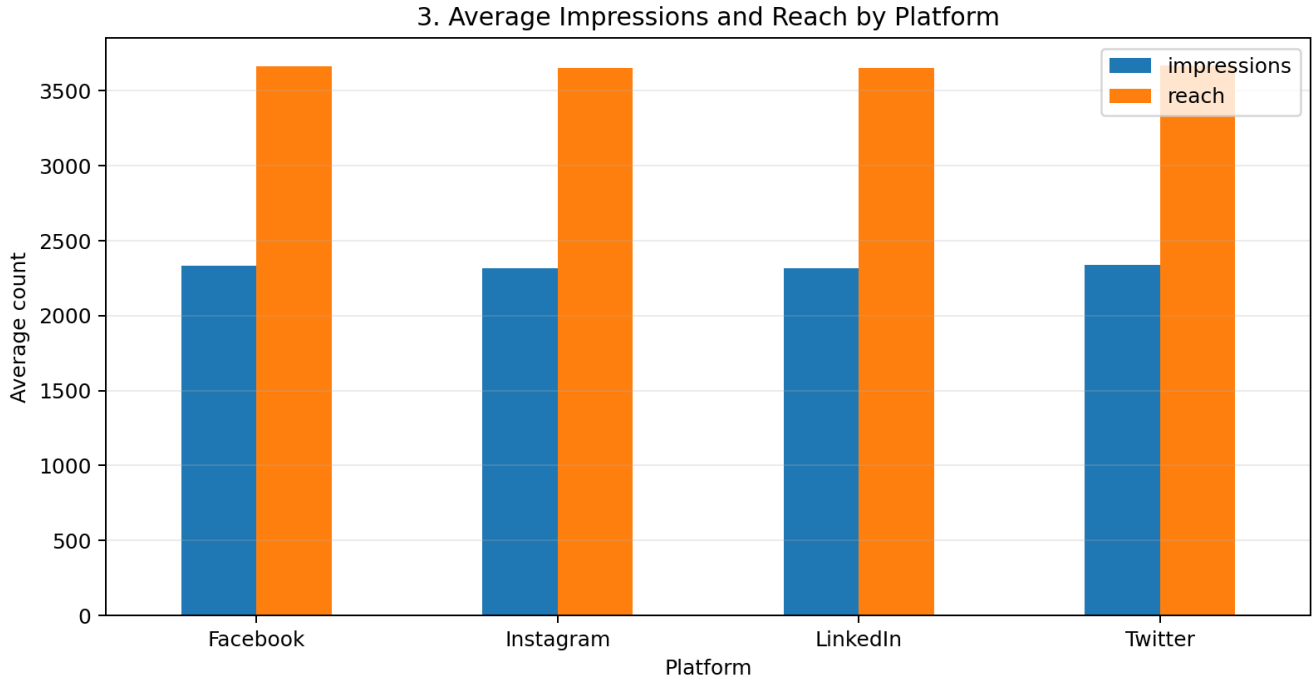

Core chart 1 — Engagement rate by post type

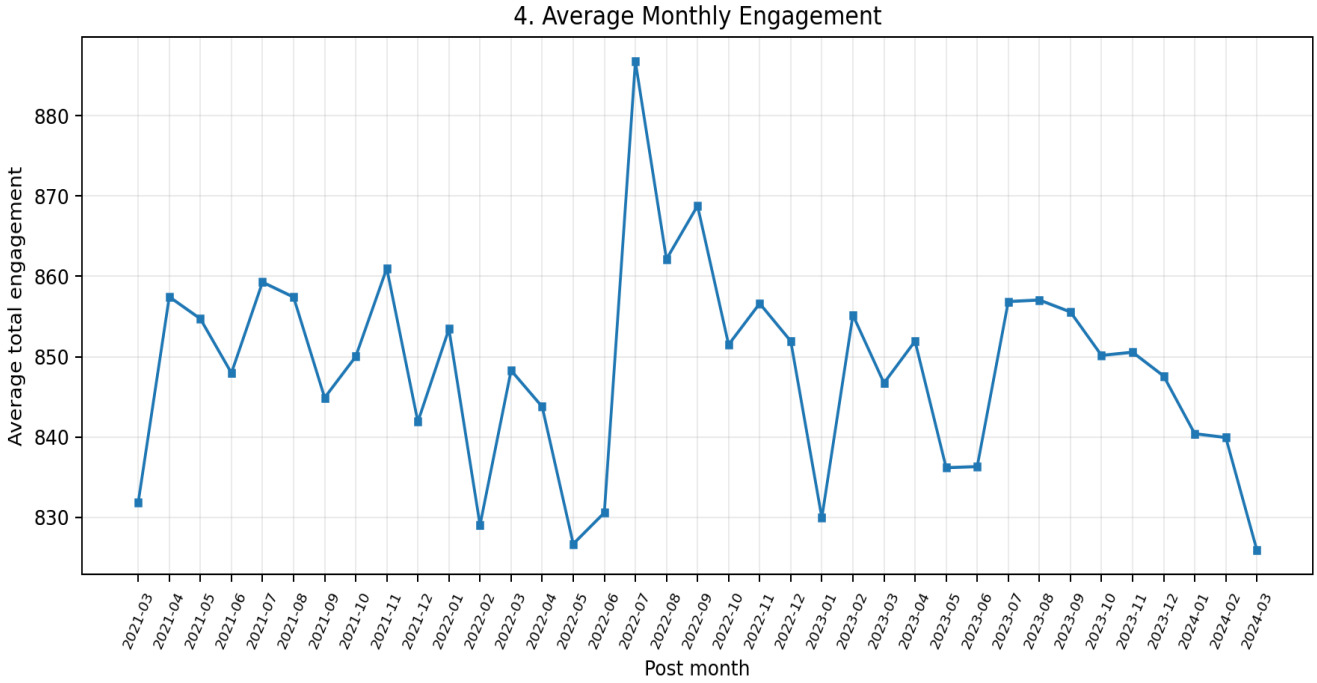

Core chart 2 — Average engagement by posting hour

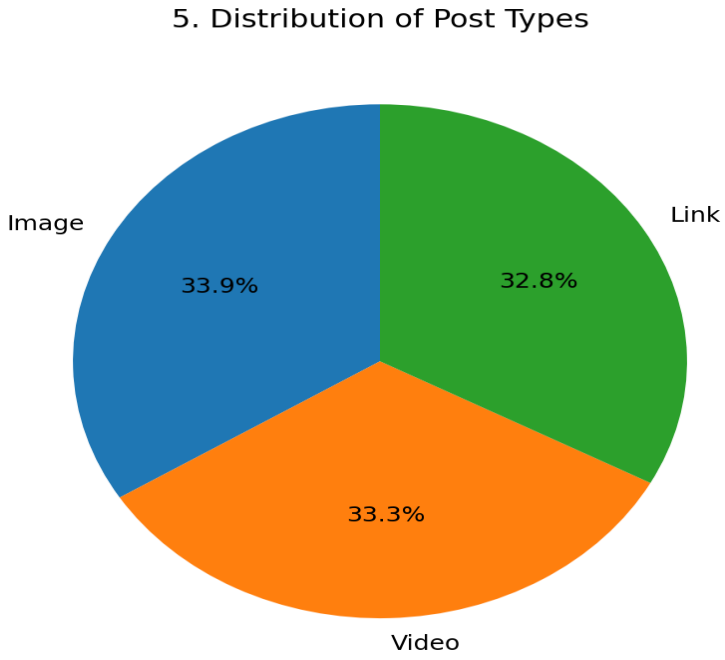

Core chart 3 — Impressions and reach by platform

Core chart 4 — Average monthly engagement

Additional chart — Post type distribution

Interpretation and limitations

The supplied processed file contains 19,885 records spanning 08 Mar 2021 to 08 Mar 2024. These summaries describe this dataset only. A higher average in a group does not prove that the group caused greater engagement. Posting-hour and monthly comparisons are descriptive, and group sizes may differ. The monthly chart reports average engagement per post for each month, not the sum of engagement across all posts.

Source: DA-020_final_processed_data.csv supplied for this project. Charts reproduce the four core analysis views defined in the uploaded notebook; the post-type distribution is an additional static rendering of the notebook's interactive donut chart.
